Daily Weather AI Email Automation

A short, shareable overview of an automated daily weather reporting project.

PROJECT PURPOSE
Provide a clear daily weather update automatically by email, helping the recipient prepare for the day.

How it works

The automation follows a simple daily process:

1. Start automatically
A schedule starts the workflow at a chosen time each day.

2. Get weather information
The workflow collects current weather details for Bahrain, including temperature, conditions, wind, and the feels-like temperature.

3. Create a readable report
Artificial intelligence turns the weather information into a concise report with a daily recommendation.

4. Send the email
The completed report is delivered as a neatly formatted email.

Key features

Feature	What it provides
Daily automation	Runs on a chosen schedule
Weather summary	Includes key conditions and temperatures
Practical recommendation	Provides an easy-to-understand suggestion for the day
Email-ready formatting	Uses a clear table and organized sections

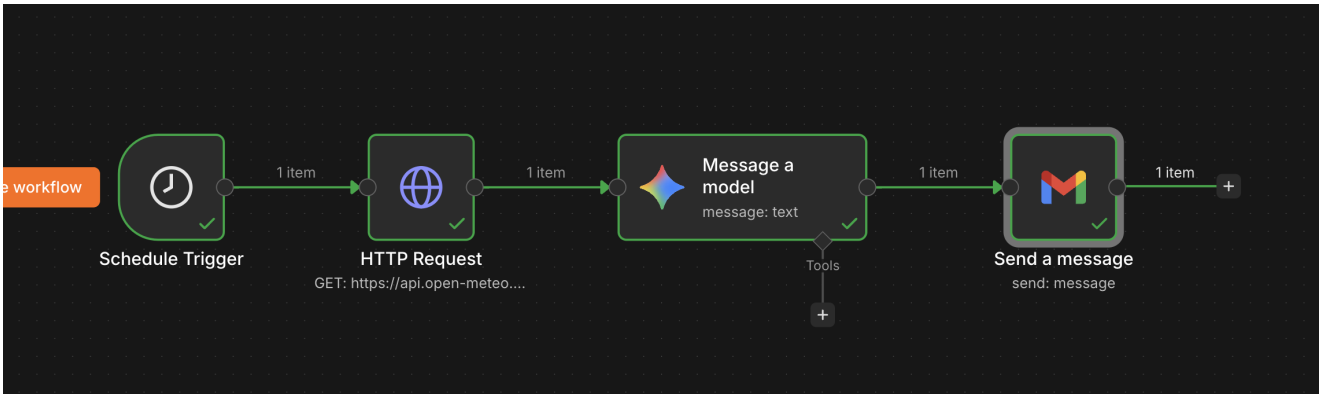

Current status

The workflow has been set up, tested, and published. It is ready to send reports according to its daily schedule.

This document intentionally contains no credentials, personal email addresses, private keys, or implementation code.

Workflow overview

The following image shows the simple flow from scheduled start to weather retrieval, report creation, and email delivery.
